The catalogue covers slip-ring induction motors called also wound rotor induction motors that are applied to start a high inertia load or a load that requires a very high starting torque across the full speed range. These motors can be also applied in drives where limited speed regulation is required.

Our motors are designed for long life and reliable operation.

FEATURES AND BENEFITS

The slip-ring motor is an induction machine where the rotor comprises a set of coils that are terminated in slip rings to which external resistance can be connected. The stator is the same as is used with a standard squirrel cage motor.

By changing the resistance connected to the rotor circuit, the speed/current and speed/torque curves can be altered.

By correctly selecting the resistors used in the secondary

resistance or slip ring starter, the motor is able to produce maximum torque at a relatively low current from zero speed to full speed. A secondary use of the slip ring motor, is to provide a means of speed control. Because the torque curve of the motor is effectively modified by the resistance connected to the rotor circuit, the speed of the motor can be altered. Increasing the value of resistance on the rotor circuit will move the speed of maximum torque down.

ORDERING INFORMATION

When placing an order, the following motor data should be given:

- Motor type designation
- Rated output
- Rated speed
- Supply voltages
- Frequency
- Mounting arrangements
- Degree of protection
- Special requirements

Information concerning additional accessories e.g.

- Thermal protection
- Anticondensation heaters
- Vibration sensors, etc.

As part of our development program, we reserve the right to alter or amend any of the specifications included in this catalog without giving prior notice.

Totally Enclosed Motors IP 54 (IP 55)
Insulation Class F

Specific resistance k:

If connected to rotor winding the starting torque of motor is equal to the rated torque.

$$k = \frac{\sqrt{3} \times U_2}{3 \times I_2} \text{ [}\Omega\text{]}$$

where: U₂ - rotor voltage [V]
I₂ - rotor current [A]
